## **BEST AVAILABLE IMAGES**

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

## IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

#### Rejections

**DETAILED ACTION** 

1. The text of those sections of Title 35, U.S. code not included in this action can be found in a prior Office action.

#### Claim Rejections - 35 USC § 103

2. <u>Claims 21-23, 28-34, and 37-40</u> are rejected under 35 U.S.C. 103(a) as being unpatentable over <u>Hashimoto et al.</u> (U.S. Patent No. 5,931,905) in view of <u>Paul</u> (U.S. Patent No. 6,052,709).

Regarding <u>claims 21, 32, and 40</u>, <u>Hashimoto et al.</u> teaches a method/system for eliminating unauthorized email on a network comprising the steps of:

- Establishing a connection on a network between an email-receiving server and an email-sending server (fig. 17, ref. num 20A and 20B);
- Making accessible to the email-receiving server for each subscribing user an
  authorized senders list (ASL list) of email addresses of external users
  authorized/not authorized to send email to the user (col. 12, lines 42-50 and
  col. 13, lines 5-9),
- Receiving at the email-receiving server a message from the email-sending server
  requesting to send email which is addressed to a user deemed to receive email
  through the email-receiving server and which is addressed from a given sender
  address (col. 10, lines 31-44);

Art Unit: 2136

- Causing the email-receiving server to check whether the user the intended email
  is addressed to is a user which receives email through the email-receiving
  server, and, if so, then causing the email-receiving server to check whether the
  sender address of the intended email is on the user's ASL list of external users
  not authorized to send email to the user (col. 12, lines 38-41); and
- If the sender address of the intended email is recognized as being on the user's ASL list, causing the email-receiving server to send a reply message to the email-sending server that the sending of the email to the email-receiving server will be accepted, otherwise if the sender address of the intended email is not recognized as being on the user's ASL list, causing the email-receiving server to send an error message to the email-sending server that the email-receiving server will not accept the sending of the email to the email-receiving server (col. 12, line 62 through col. 13, line 4).

Hashimoto et al. does not teach wherein said email-receiving server and email-sending server utilize a common email-sending system protocol to send email on the network.

<u>Paul</u> teaches wherein said email-receiving server and email-sending server utilize a common email-sending system protocol to send email on the network (col. 9, lines 22-40).

Art Unit: 2136

It would have been obvious to one of ordinary skill in the art, at the time the invention was made, to combine wherein said email-receiving server and email-sending server utilize a common email-sending system protocol to send email on the network, as taught by <a href="Paul">Paul</a>, with the method/system of <a href="Hashimoto et al.">Hashimoto et al.</a>. It would have been obvious to combine wherein said email-receiving server and email-sending server utilize a common email-sending system protocol to send email on the network, as taught by <a href="Paul">Paul</a>, with the method/system of <a href="Hashimoto et al.">Hashimoto et al.</a> because checking and eliminating email spam at the SMTP server reduces data traffic flow on a communications link before it is stored (see col. 9, lines 27-30 of Paul).

Regarding <u>claims 22 and 33</u>, <u>Hashimoto et al.</u> in view of <u>Paul</u> teaches wherein the ASL module includes:

- An ASL database for storing ASL lists of both authorized and non-authorized sender addresses for respective users of the email-receiving server (see col. 12, lines 37-41 and col. 13, lines 5-9 of Hashimoto et al.),
- A spam processor module for checking the ASL lists for matches (see col. 12, line 67 through col. 13, line 4 of Hashimoto et al.), and
- An ASL manager for creating, maintaining, and updating the ASL lists (see col.
   12, lines 43-48 of Hashimoto et al.).

Regarding <u>claims 23 and 34</u>, <u>Hashimoto et al.</u> in view of <u>Paul</u> teaches wherein a redirector module is provided to operate with the ASL module:

Art Unit: 2136

- For receiving the message from the email-sending server requesting to send email designating the sender's FROM address and intended recipient's TO address (see fig. 7, "SENDER" and "DESTINATION" of Hashimoto et al.),
- For sending a request for validation to the spam processor module to determine
  whether the sender's FROM address matches any authorized sender address
  maintained on the ASL list corresponding to the TO address of the intended
  recipient (see col. 12, lines 62-67 of Hashimoto et al.),
- For sending the reply message accepting the email from the email-sending server if a match to an authorized sender address is found (see col. 12, line 67 through col. 13, line 1 of Hashimoto et al.), and
- For sending the error message not accepting the email if no match to an authorized sender address is found on the ASL list (see col. 13, lines 2-4 of Hashimoto et al.).

Regarding claims 28, 29, and 37, Hashimoto et al. in view of Paul teaches wherein email addresses used on email sent by a user which receives email through the email-receiving server and other addresses accessed by the user on the network are captured and stored with the ASL manager for later analysis (fig. 17, ref. num 25 of sending and receiving end); and wherein the ASL manager analyzes the captured addresses using a rules processor for processing predefined address capture rules for updating the ASL lists using data from an email address source selected from the group of email address sources consisting of: received email; sent email; user inputs to email

Art Unit: 2136

service functions on the email client; inputs from user browsing of web sites; user desktop organizer and other contact lists; and third party address program inputs (see fig. 57, ref. num 41 and col. 23, lines 24-67 of Hashimoto et al.).

Regarding claims 30 and 38, Hashimoto et al. in view of Paul teaches wherein the ASL manager analyzes the captured addresses using a rules processor for processing predefined analysis rules for updating the ASL lists using data from an analysis source selected from the group of analysis sources consisting of: user email log analysis; expiration date analysis; low/high email volume analysis; fuzzy logic analysis; and third party data analysis (Applicant states, on page 4, first paragraph, of the preliminary amendment received on August 23, 2001, "all email systems, like the Hashimoto system only scans the FROM and TO addresses of the subscriber's email in order to maintain a log identifying the email the subscribers has sent and received."

This admission suggests that the Hashimoto et al. patent, as well as other patents and publications, discloses the ASL manager selects from the group of analysis sources consisting of user email log analysis. This clearly labels the above claims as unpatentable based over a prior art teaching.).

Regarding <u>claims 31 and 39</u>, <u>Hashimoto et al.</u> in view of <u>Paul</u> teaches wherein the ASL manager maintains the ASL lists to designate a sender-address status for each sender address selected from the group of sender-address statuses consisting of: always authorized as a friend; authorized as a friend over a date range; authorized as a

Art Unit: 2136

friend before an expiration date; always rejected as a spammer; rejected as a spammer matching a black list; and rejected as a spammer sent with an error message (see col. 13, lines 5-24 of Hashimoto et al.).

Claims 24-27, 35, and 36 are rejected under 35 U.S.C. 103(a) as being unpatentable over <u>Hashimoto et al.</u> (USPN '905) in view of <u>Paul</u> (USPN '709), and further in view of Lillibridge et al. (U.S. Patent No. 6.195.698).

The combination of <u>Hashimoto et al.</u> in view of <u>Paul</u> teaches wherein the WBM module sends a message to the address of the sender of the non-accepted email notifying the sender to confirm with the WBM module that the sender is a legitimate sender of email to the intended recipient (see col. 13, lines 2-4 of Hashimoto et al.). However, <u>Hashimoto et al.</u> in view of <u>Paul</u> does not teach wherein a web-based messaging (WBM) module is provided to which the sender of intended email that is not accepted by the email-receiving server is redirected by the redirector module.

<u>Lillibridge</u> teaches wherein a web-based messaging (WBM) module is provided to which the sender of intended email that is not accepted by the email-receiving server is redirected by the redirector module (fig. 5).

It would have been obvious to one of ordinary skill in the art, at the time the invention was made, to combine a WBM module to confirm that a sender is a legitimate

Art Unit: 2136

sender of email to the intended recipient, as taught by <u>Lillibridge et al.</u>, to the method/system of <u>Hashimoto et al./Paul</u>. It would have been obvious to one of ordinary skill in the art to combine a WBM module to confirm that a sender is a legitimate sender of email to the intended recipient, as taught by <u>Lillibridge et al.</u> to the method/system of <u>Hashimoto et al./Paul</u> because most SPAM messages are generated by a machine/agent to distribute to thousands of email addresses. The WBM module will prevent non-human messages from getting to a receivers inbox, thus reducing the hassle of SPAM (see col. 9, lines 3-8 of Lillibridge et al.).

This new method/system, as taught by the combination of <u>Hashimoto et al./Paul</u> and <u>Lillibridge et al.</u> would cause an unregistered email account to be authenticated by the WBM module. This module would force a sender to type in humanly perceptible characters to verify the sender is indeed a human. After correctly typing in the characters, the sender would be allowed to send a message to the intended recipient.

Regarding <u>claim 25</u>, <u>Hashimoto et al./Paul</u> as modified by <u>Lillibridge et al.</u>
teaches wherein the WBM module is a website accessible on the network which invites the notified sender to log on and confirm that the sender is a legitimate sender of email through an interaction procedure which can only be performed by a human (see col. 5, lines 41-43 and col. 6, lines 11-16 of Lillibridge et al.).

Regarding <u>claim 26</u>, <u>Hashimoto et al./Paul</u> as modified by <u>Lillibridge et al.</u> teaches wherein the interaction procedure includes a display of a graphic image of a

Art Unit: 2136

word in a non-standard font, and a prompt to the sender to enter in a word corresponding to the graphic image of the word, whereby the system can confirm that the interaction procedure is not performed by a mechanical program (see fig. 4, ref. num 410 & 420 and col. 5, lines 65-67 of Lillibridge et al.).

Regarding claims 27 and 36, Hashimoto et al./Paul as modified by Lillibridge et al. teaches wherein once the sender is confirmed as a legitimate sender of email to the intended recipient user, the WBM website sends a message to the redirector module at the user's email-receiving server that the sender is confirmed as a legitimate sender by the WBM website (see col. 6, lines 64-67 of Lillibridge et al., in this case, the request, Q, is to send a message to the recipient.).

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Brandon Hoffman whose telephone number is 703-305-4662. The examiner can normally be reached on M-F 8:30 - 5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ayaz Sheikh can be reached on 703-305-9648. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
